Introduction

Project objectives

This proposal outlines the technical approach, development timeline, and financial investment required to deploy a secure Loan Management System for **Alinafe Capital**.

INFOVITS LIMITED (the developer) proposes to supply and install this Web-Based Application. Outlined in the following document is the proposed system functionality, designed to safely connect money lenders to money borrowers while managing the risks associated with private lending.

The developer will work with the specified requirements, specifically the interaction between Lenders, Borrowers, and Alinafe staff, to design and implement the system. The customization of modules, such as Collateral Management and Loan Default tracking, shall conform strictly to the client's specifications and business model.

The Proposal includes the development of the core modules requested (Loans, Collateral, Users) and also provision to add, remove, or modify system features to suit the company's current and future operation models.

Section 1- Initial Development

Goals Identified

Provision of a loan management system for Alinafe Capital that automates loan brokerage operations currently handled manually or through fragmented processes.

To provide a centralized information system that enables efficient management of lenders, borrowers, employees, loan offers, approvals, collateral tracking, and loan defaults within a single secure platform.

Use of the system to improve control, transparency, and operational efficiency in loan processing, while supporting accurate record keeping and effective management oversight.

Training of Alinafe Company users to ensure effective adoption and proper use of the loan management system.

Section 2 - Solution

System

Interface

Clean and simple yet attractive interface will be provided in the system. A simple and clear interface will help users to use the system effectively not to be put off. The system will have web based interface so that it will be used easily across users in different sites.

The interface will be:

Clear: Clarity is the most important element of the user interface. The whole purpose of the user interface design is to enable users to interact with the loan management system by communicating meaning and function. If users cannot easily understand how the system works or where to navigate, they may become confused and frustrated. The Alinafe Capital Loan Management System will therefore have clear menus and buttons placed in easily accessible locations, using icons and labels that are not confusing.

Concise: The menus, buttons, icons, and navigation labels in the system will be concise to avoid unnecessary steps when performing loan-related activities such as loan application review, approvals, collateral tracking, and loan monitoring.

Familiar: Icons and terminology used in the system will be familiar and consistent with those commonly used in financial and administrative software, enabling users to quickly understand their meaning and functionality.

Responsive: The interface will be fast loading. The system will provide feedback to users, such as confirmation messages when actions are completed successfully or status indicators when data is loading, to ensure users are kept informed.

Consistent: The interface will be consistent across all modules. Consistency will allow users to develop usage patterns and easily recognize system elements and their functions across different parts of the application.

Attractive: A good interface is attractive. Users will enjoy using the system and will be encouraged to interact with the platform regularly.

Efficient: The interface will allow users to perform loan management functions faster and with less effort.

Forgiving: The system interface will intelligently handle user actions to minimize errors and prevent costly mistakes during data entry or approvals.

Functionality Attributes

The system will have:

Correctness: The system will meet all specifications for the Alinafe Capital's Loan Management System. If new specifications are proposed and approved, the system shall be updated accordingly.

Usability / Learnability: The effort required to learn and use the system will be minimal for Alinafe Capital's staff, lenders, and borrowers.

Integrity: The system will be able to operate alongside other software without causing side effects or conflicts.

Reliability: The system will operate consistently without failure during normal execution.

Efficiency: The system will make effective use of storage space and system resources while meeting required performance standards.

Security: The system will implement appropriate security measures to protect user data, loan records, and collateral information from unauthorized access.

Maintainability: Maintenance of the system will be simple and manageable.

Flexibility: Changes to the system can be made easily without disrupting core operations.

Extensibility: It will be easy to extend the system with additional modules or features in the future.

Scalability: The system will support growth in users, loans, and data volume as Alinafe Company expands.

System Functionality Logic/Design

The system will have independent modules developed separately but coordinated to work together. The modules will be able to pass data and execution instructions and process outcomes to each other.

The system will have:

Forms for user registration and login and other relevant information. This will include text boxes, buttons, and other relevant controls for entering valid data to be processed by the system. All users of the system, including lenders, borrowers, and employees, will be registered with defined access rights based on their roles.

Loan Request and Loan Offer Module will allow borrowers to submit loan requests specifying loan amount, interest rate, loan period, and proposed collateral. Lenders will be able to post loan offers indicating loan amount, interest rate, and repayment duration. All loan requests and loan offers will be accessible on the Alinafe Capital platform for review.

Accepted Loans Module will list all loan requests that have been accepted by lenders after reviewing borrower details and proposed collateral.

Approved Loans Module will list all loans that have been approved by the Loans Manager or CEO following loan scrutiny and assessment. The system will ensure that no loan proceeds to disbursement without proper authorization.

Disapproved Loans Module will record all loan requests that have been denied following review and assessment. The system will maintain records of disapproved loans for reference and audit purposes.

Loan Defaults Module will be included to track loans that have reached their maturity date without full repayment. This module will assist management in identifying non-performing loans and initiating appropriate recovery actions.

Collateral Management Module will be provided to manage all collateral associated with loans.

This will include:

Received Collateral Module to record and track assets pledged by borrowers against loans.

Released Collateral Module to manage the release of collateral once a loan has been fully repaid.

Sold Collateral Module to track the sale of collateral in cases where loans have defaulted and recovery is required.

Database for storing all user records, loan information, collateral data, and system transactions required for effective loan management, monitoring, and reporting.

System Technology Stack

The system will be built using modern, high performance set of technologies to ensure speed, security, and reliability.

Frontend: React.js

Backend: Node.js

Database: MySQL

Messaging tool: RabbitMQ

Caching: Redis

External integration: SMS Gateway

Section 3- proposed timeline/schedule

The development time (deadlines)

The development and implementation of the Alinafe Capital's Loan Management System shall be completed within a period of two (2) months, subject to timely approvals and availability of required information from the client.

Phase 1- Approval to Proceed

Duration: 1 day

Deliverable: signed agreement and project kickoff authorization

Phase 2- Requirements Gathering

Duration: 7 days

During this phase, detailed system requirements will be allocated through consultations with Alinafe Capital management and relevant stakeholders.

Deliverable: confirmed functional and operational requirements

Phase 3- System Requirements Specification (SRS)

Duration: 6 days

A formal system Requirements Specification document will be prepared based on the agreed requirements and submitted for review and approval.

Deliverable: Approved SRS document.

Phase 4 – Software Development (Agile)

Duration: 30 days

The system will be developed using an Agile approach, with functionality delivered in iterations. Core modules including user management, loan offers, loan requests, approvals, collateral management, and loan defaults will be implemented and reviewed progressively.

Deliverable: Fully developed Loan Management System.

Phase 5- System Deployment

Duration: 6 days

This phase involves system installation, configuration, and deployment to the production environment.

Deliverable: Deployed and configured system.

Phase 6- Training and System Testing

Duration: 7 days

System testing and user acceptance testing will be conducted in collaboration with Alinafe Capital staff. Training will be provided to system users to ensure effective usage of the system.

Deliverable: Tested system and trained users.

Phase 7- Launch and Phase Out

Duration: 4 days

The system will be made live for operational use. Final adjustments will be completed, and the project will be formally handed over upon client satisfaction.

Deliverable: Live system and project sign-off.

Phase 8- Continuous Support (Warranty period)

Duration: 4 Months

The developer will provide complimentary technical support and system maintenance for a period of four (4) months following the system launch. This includes bug fixes, stability monitoring, and ensuring the system performs as designed.

Upon expiration of this four month period, a separate Service Level Agreement (SLA) will be discussed to govern ongoing support and feature enhancements.

Section 4- Financial Proposal

Resource Composition: to ensure the successful delivery of the Alinafe Capital's Loan Management System within the strict 2-month timeline, the following technical team will be dedicated to the project:

Role	Responsibility
System Analyst	System design and requirements analysis.
Senior Software Developer	Core architecture and security logic.
Junior Software Developer (2)	User interface and module coding.
Quality Assurance manager	System testing and validation

Price Quotation

Item	Amount (MWK)
System Analysis & Design	1,800,000.00
Software Development	7,200,000.00
Server & Security Setup	1,200,000.00
Training & Documentation	1,800,000.00
Subtotal Cost	12,000,000.00
VAT (17.5%)	2,100,000.00
Grand Total	14,100,000.00

Payment Method

we will need 50% of the total project cost upon the signing of the agreement to mobilize resources and start the project. The remaining 50% will be needed at the completion of phase 7 (Launch and phase out).
